Surface Disinfection

FAQ

Where to Disinfect?

Many surfaces and objects you come in contact with everyday are covered in germs especially home and office such as **table surfaces, doorknobs, toys and game controller of your kids** and etc.

Aerosol vs Liquid

In general, aerosol are liquid particles that suspended in air. The size of water droplets are smaller than liquid spray but both are equally as effective as long as alcohol concentration is above 60% and its cover the targeted surface.

Characteristics	Disinfectant Spray	Surface Cleaning & Disinfectant
Dispense form	Aerosol	Liquid
Particle sizes	< 10 µm	100 - 500 µm
Alcohols	Isopropyl Alcohol	
Concentration	70 %	75 %
Fragrance	No	No

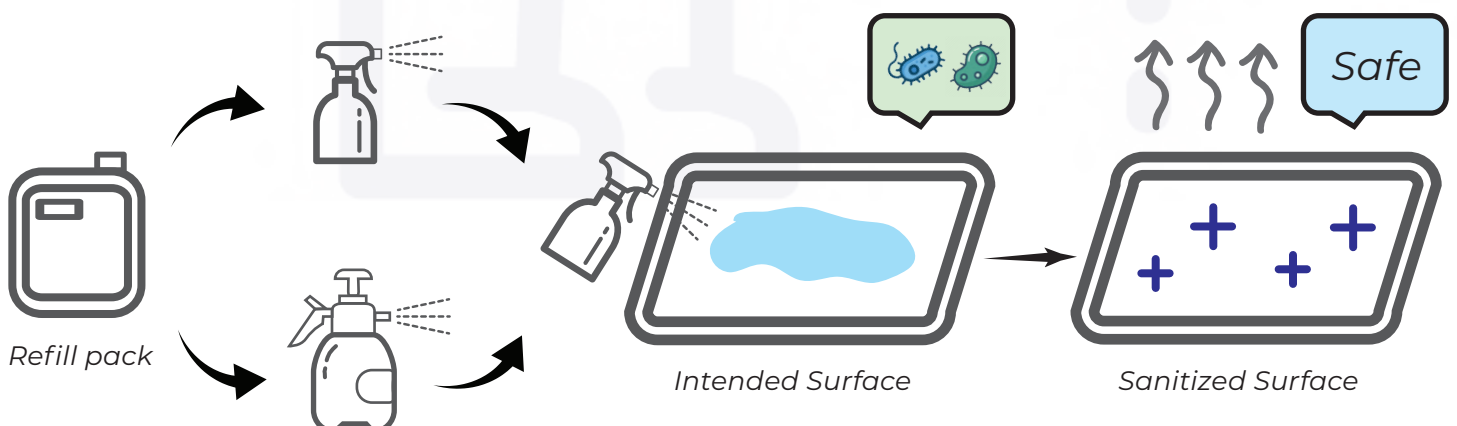

Difference between cleaning & disinfecting?

Cleaning refers to the removal of germs and dirt from surfaces. **Cleaning will not kill germs; it simply removes them** or reduces the number of germs in order to lower the risk of infection.

Disinfecting is a process that **uses chemicals to kill germs**. To reduce the risk of spreading virus, CDC recommends that hard surfaces should be cleaned **AND disinfected frequently**.

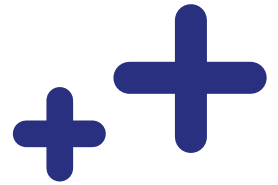

Usage Instruction

For Alcogiene™ Surface Cleaning & Disinfectant, pour the ready used solution into a spray dispenser or spray bottle. Thoroughly clean the surfaces if visibly dirty, spray on the intended surface to disinfect. Let the solvent evaporate off naturally around 15 – 30 sec. Once done, the surface is safe and free from germs.
